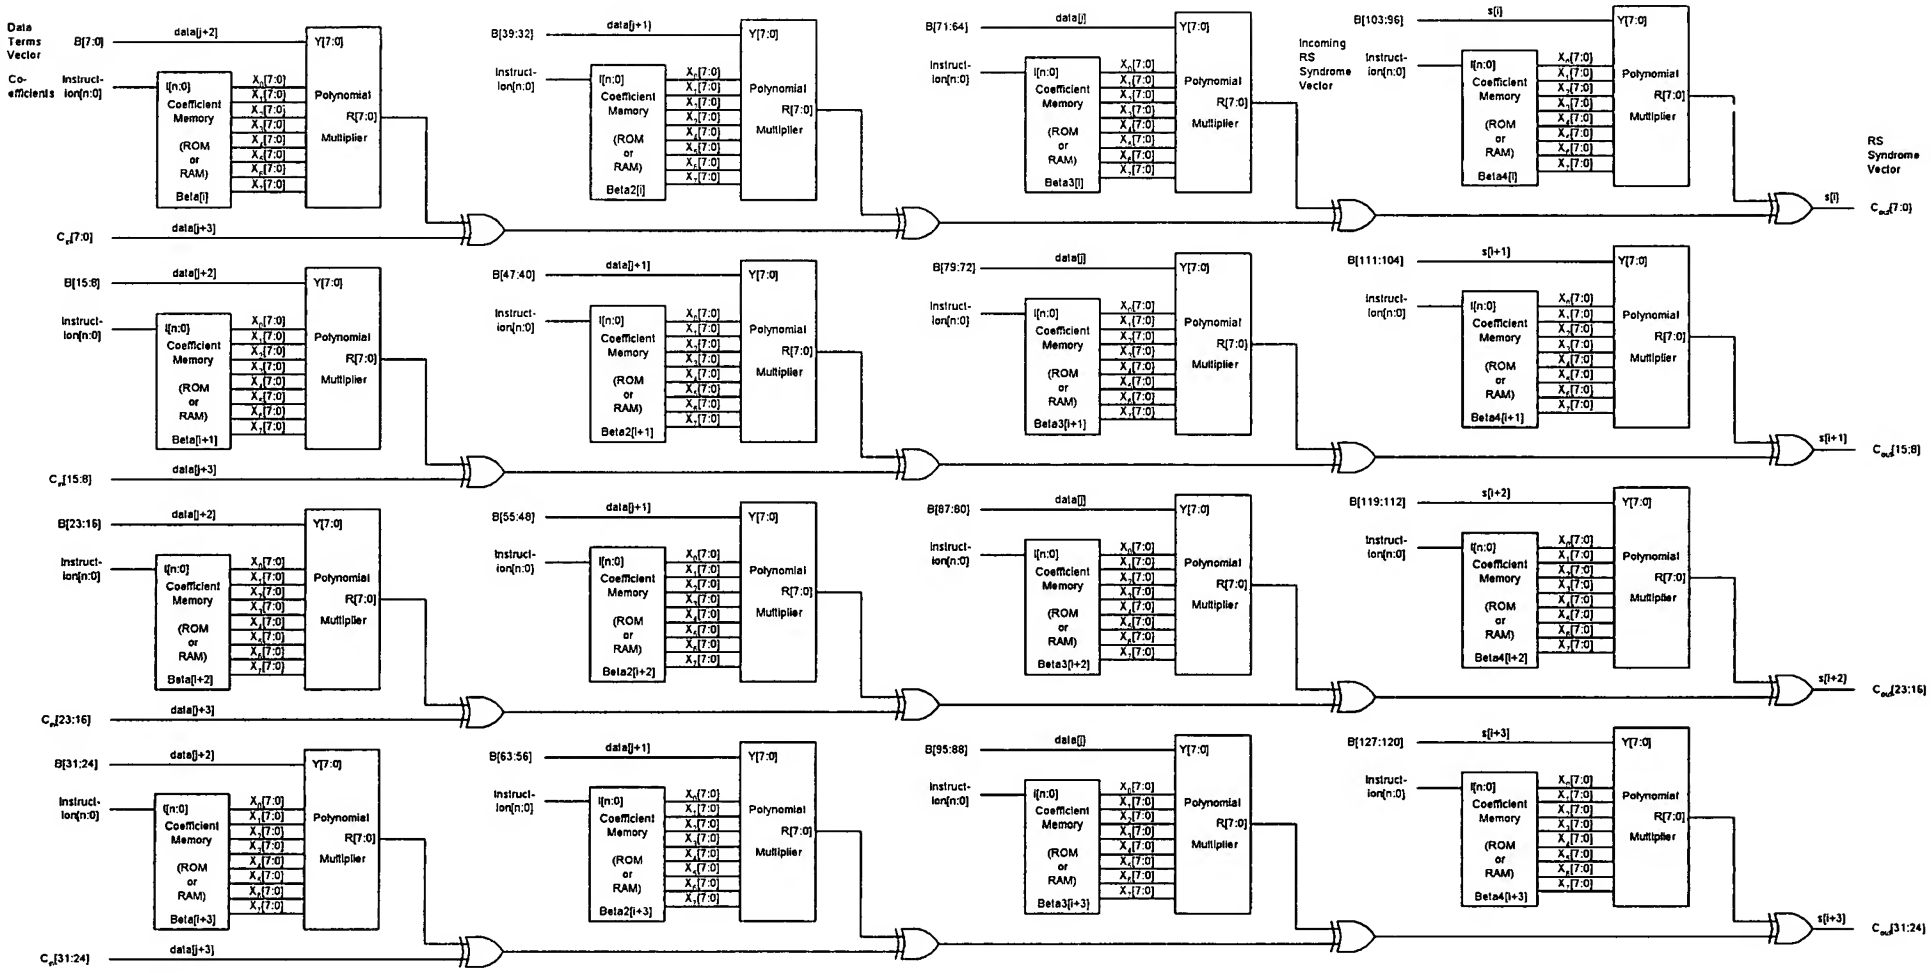
Generated by common hardware above
GF Kernel instruction: crc[3:0] = crc[3:0] ^ gf_multi (a[3:0], b[15:0])
As used in the example software, a is a set of four byte feedback term and b is a set of sixteen polynomial terms
The set of sixteen polynomial terms could be referenced from a ROM as part of the GF Kernel instruction processor as only a small number of terms are necessary for each Read Solomon coder type
Note: Byte indicies shown on instruction and bit indicies shown on hardware

Figure 12



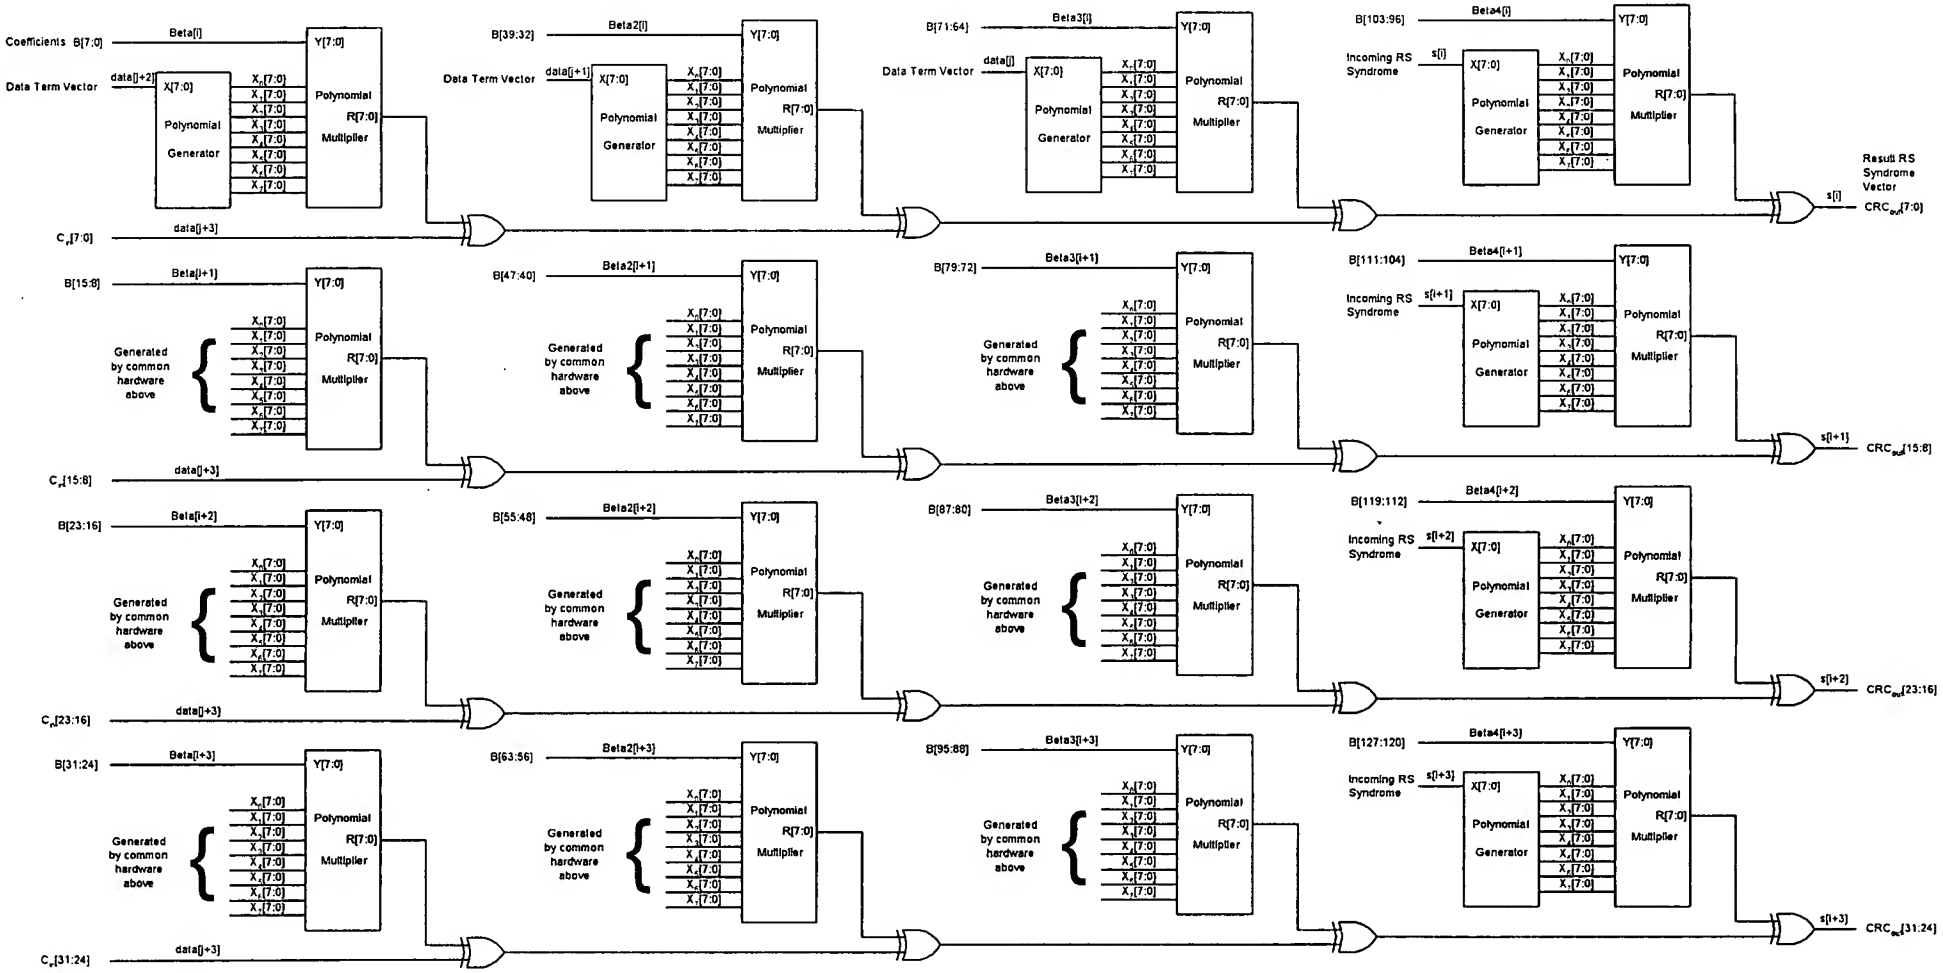
GF Kernel Instruction: c[3:0] = c[3:0] ^ gf_mult (a[3:0], b[15:0])

As used in the example software, a is a set of four byte feedback term and b is a set of sixteen polynomial terms

The set of sixteen polynomial terms should be referenced from a ROM as part of the GF Kernel instruction processor as only a small number of terms are necessary for each Reed Solomon coder type

Note: Byte indicies shown on instruction and bit indicies shown on hardware

Figure 13



GF Kernel instruction: c[3:0] = c[3:0] ^ gf_mult (a[3:0], b[15:0])

As used in the example software, a is a set of four byte feedback term and b is a set of sixteen polynomial terms

The set of sixteen polynomial terms should be referenced from a ROM as part of the GF Kernel instruction processor as only a small number of terms are necessary for each Reed Solomon coder type

Note: Byte indicies shown on instruction and bit indicies shown on hardware
